# Variables and Types

# **Exercises**

Week 2

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 6.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

What is the purpose of a <i>variable</i> within Python?  Answer:
The purpose of the variable is to store values for later access.

Write a simple Python statement that creates and assigns a value of 3.142 to a variable called 'pi'

Answer:

pi='3.142"

\_ Which of the following is NOT a valid name for a variable within Python? total

result

question?

Δ	nswe	r٠

question?

\_ Following the execution of the code below, what will be stored in the variable 'age'?

```
age = 10 + 20
age = age + 5
```

## Answer:

35

In the answer box below write the *exact* output that would be displayed if the following statement was executed (assuming age has been created as in the previous question):

```
print("The age value is",age)
```

## Answer:

The age value is 35.

\_ Which of the following is an example of an Augmented Assignment in Python? total

```
= 20

total = total + 5

total *= 100

total = max
```

# Answer:

total*=100
_ Which of the following is an example of an <b>integer</b> type variable?
result = "xyz"
result = 20
result = 20.5
result = False
Answer:
20
True and False
Following the execution of the code below, what will be the <i>data-type</i> of the variable 'average'?
<pre>average = total / count</pre>
Answer:
float

Following the execution of the code below, what will be the <i>data-type</i> of the variable 'message'?
<pre>message = "hello there!"</pre>
Answer:
string
_ What determines the current data type of a variable?
Answer:
As Python is a dynamically typed language, the current data type is determined by the last value assigned to it.
_ What is the purpose of the built-in type () function?
Answer:
To find out the data type of a variable
What would be the output following the execution of the following code?
type (10.2)  Answer:
<class 'float'=""></class>
_ Does the Python language support <i>Dynamic Typing</i> , or <i>Static Typing</i> ?
Answer:
Dynamic typing

_ Which of the following is an example of a function call?
answer = 10
print(answer)
total *= 10
10 + 20
Answer:
print
_ What is the name given to the values that are passed to a function within the
parentheses?
Answer:
parameter
_ What is the purpose of the built-in input() function?
Answer:
To read input from the user
_ What is the data type of the value returned by the input () function?
Answer:
string

Use the Python interpreter to input a small Python program that prints your name and address on the screen. Once this works type the program in the answer box below.

#### Answer:

name=input("What is your name?")
address=input("Give me your address")
print("The users name is",name)
print("And your address is",address)

Within the answer box below write a small Python program, that when run, would print the following message including the double quotes -

```
Hello, is your name "Bwian"?
```

## Answer:

print("Hello, is you name "Bwian"?")

Now write a second small Python program, that when run, would print the following message including the single quotes -

```
Or is your name 'Woger'?
```

### Answer:

print("Or is your name 'Woger"")

Within the answer box below write a small Python program, that when run, uses *escape* sequences to print the following text exactly.

```
This is a string containing a backslash (\), a single quote ('), a double quote (") and is split across multiple lines
```

## Answer:

 $print("This is a string containing a backslash (\), \n a single quote ('), a double quote (\")\n and is split across multiple lines")$ 

Within the answer box below write a small Python program, that when run, uses *triple quotes* to print the following text exactly.

```
This is a string containing a backslash (\), a single quote ('), a double quote (") and is split across multiple lines
```

## Answer:

```
print(""This is a string containing a backslash (\), a single quote ('), a double quote (") and is split across multiple lines"")
```

Use the Python interpreter to input a small Python program that asks the user to input a temperature in Fahrenheit. Once the value has been input, display a message that shows the same temperature in celsius. You may have to do some research to find out the conversion method. Once this works, type the program in the answer box below.

### Answer:

```
fahrenheit=float("give the temperature in fahrenheit") celsius=(fahrenheit-32)*5/9 print("The temperature in celsius is",celcius"C")
```

Within the answer box below write a small Python program that asks the user to enter two values. Store these in variables called 'a' and 'b' respectively.

## Answer:

```
a=input("First value")
b=input("Second value")
```

Once the values have been input use three calls to the print() function to show output such as the following (in this example the user entered 10.2 and 18.3) -

```
The value 'a' was 10.2 and the value 'b' was 18.3

The sum of 'a' and 'b' is 28.5

The product of 'a' and 'b' is 186.66
```

## Answer:

```
c=int(a)
d=int(b)
sum=c+d
Print("The value of 'a' and 'b' is ,sum")
```

\_\_\_\_\_

Python includes a built-in function called **max()**. When this is called with multiple argument values it returns the largest of the given arguments. e.g.

```
\max(20, 50, 30) # this would return 50
```

Within the answer box below write a small program that asks the user to input three values. Store these in variables (the names are up to you) then use the **max()** function to display the largest of the input values.

#### Answer:

```
a=int(input("First value"))
b=int(input("Second value"))
c=int(input("Third value"))
p=max(a,b,c)
print("the maximum value is",p)
```

Using the Python interpreter execute your code, then examine the output generated when the input the values are 'hello', 'welcome', and 'bye'

Does the program still show the maximum value? If not, what does it show?

## Answer:

It will show the maximum value depending upon the dictionary value of the word.

Given the following definition:

```
name = "Black Knight"
```

What would each of the following Python statements display?

```
print( name[0] )
```

## Answer:

```
В
print( name[4] )
Answer:
k
print( name[-1] )
Answer:
print(name[-2])
Answer:
h
print( name[2:5] )
Answer:
ack
print( name[6:] )
Answer:
night
print( name[:5] )
Answer:
black
print( name[:] )
Answer:
```

Black knight
<pre>names = "Terry"</pre>
names = 10
<pre>names = [ "Mark", "Jon", "Amanda", "Edward", "Sally"</pre>
] names = "Mark", "Jon", "Amanda"
Answer:
The third one
_ Is the following a valid <b>List</b> , even though it contains values based on different data-types?
values = [10.2, "Jon", False, "Edward", True ]
Anguar
Answer:  It is
_ If a value is <b>mutable</b> , can it be modified after it has been created?
Answer:
Yes it can

_ What term is used to describe a value that cannot be changed once it has been created?
Answer:
immutale
_ Is a List mutable or immutable?
Answer:
mutable
Is a String mutable or immutable?
Anowar
immutable
_ Given the following definition -
<pre>names = ["Terry", "John", "Michael", "Eric", "Terry",</pre>
"Graham"] What would each of the following Python statements display?
<pre>print( names[2] )</pre>
Answer:
michael
<pre>print( names[-2] )</pre>
Answer:
terry

```
print( names[0:3] )
Answer:

["terry", "john", "michael"]

names = names + "Brian"
print( names )

Answer:

Error.only concatenate list not strings

names[0:1] = ["Mark", "Jon"]
print( names )

Answer:

["mark', 'jon', 'John', 'Michael', 'Eric', 'Terry', 'Graham']
```

What built-in function within Python can be used to find out how many elements are contained within a string or list?

Answer:

len
